

tac-build-report

Run 7ffc00bf | Status: OK

What ran: This run executed the TAC verifier/report path: routing validation, source-plan validation, receipt tests, Supabase upsert/readback, Langfuse trace emission, PR status capture, and report packaging.

What did not run: It did not execute the underlying plan workload unless that workload appears as a gate in the evidence table. For a smoke-test candidate, this means the report validates readiness and evidence flow; it is not proof that the cron commit/push tick itself ran.

Where it ran: Local Codex ran the verifier and packaged this report. GitHub Actions only ran the PR Validate test workflow on the branch push; it did not generate this report package or execute the plan workload.

Steps: 8 total / 8 ok / 0 errors. Duration: 9.855s.

PR: <https://github.com/gbauto/gbautomation/pull/43>

Verifier: codex-verifier-agent

Gate	Mode	Status	Duration
validate build routing	REAL	ok	0s
validate PRD team bundle markers	REAL	ok	0s
run build receipt unit tests	REAL	ok	6.329s
insert receipt into Supabase	REAL	ok	2.461s
verify Supabase read-back	REAL	ok	1.064s
emit Langfuse verifier trace	REAL	ok	0s
record Codex verifier invocation	REAL	ok	0s
record PR status	REAL	ok	0s

Prepared by GBAutomation. Internal report package generated from second-brain telemetry.
