

HOW GB AUTOMATION BUILDS

Production-ready by design, not by accident.

Most AI coding setups ship slop because the seams aren't engineered. Our pipeline is built by engineers with decades of experience — the bugs aren't in the prompts, they're in the seams. We engineer the seams.

AI velocity. Engineering discipline.

Grounded patterns from engineers with decades of experience.

The 10 pillars that prevent AI slop

Each pillar is a guardrail we shipped because we hit the failure mode and built the fix into the pipeline. None of these are theoretical.

Database-logged skill runs

01

Every agent execution writes to Supabase: run_id, trace_id, status, input hash, output payload, cost, timing. Nothing happens in the dark.

AUDIT EVERY AI ACTION **weeks later.**

Agent tracing & telemetry

02

Every agent call is traced end-to-end via Langfuse: inputs, tool calls, token spend, latency, errors. Replay any decision and see exactly why the AI did what it did.

THE SINGLE THING **vibe-coders skip.**

Linear-driven dispatch

03

Work enters through Linear issues, not chat. Every build has an issue number, owner, audit trail, and label-gated routing through the right agent team.

NO WORK HAPPENS **outside the system.**

Plan-and-review two-step

04

Before code, a PRD. Before merge, human approval. The AI proposes; humans approve at two checkpoints. Speed without surrendering oversight.

VELOCITY **with brakes.**

Proper git hygiene

05

Every build runs on its own branch. PRs only. No force-pushes, no resets. Files never get lost. Reflog and recovery branches as a safety net.

NO FILE **has ever vanished.**

Silent-failure detection

06

Agents that claim success while actually failing get caught. We scan output for failure markers even when exit codes are clean. The kind of catch only experience teaches you.

EXIT CODE ZERO **doesn't fool us.**

Idempotent & dedup-safe

07

The system won't redo shipped work, won't double-pick an issue, won't stomp on in-flight branches. Open PR exists? Skip. Merged PR exists? Skip. Run it 96 times a day, it stays sane.

SAFE TO RUN **every 15 minutes.**

Live-credential OAuth

08

Cron pulls auth from AWS Secrets Manager every run. No stale keys, no "it stopped working overnight", no API keys leaking into client code or test fixtures.

NO 3AM **auth-expired pages.**

Brand & quality gates

09

Every visual artifact passes through canonical brand-token validation. Outputs match the live site's exact fonts and colors. Sources are cross-checked. No fabricated proof claims, no off-spec slop.

OUTPUT READY **for prospects.**

Async parallel dispatch

10

Up to 96 build cycles per day, fully parallel via Linear's queue and git worktrees. Engineering velocity without engineering headcount.

A TEAM'S OUTPUT **from one operator.**

How a build flows through the pipeline

From Linear ticket to merged PR — the path every TAC build takes, with the guardrail at each seam.

What this means for you

You see what the AI did.

Every action traced. Every output logged. Every cost tracked. No black boxes.

You approve before it ships.

Plan-then-build, PR-then-merge. Two human checkpoints. You stay in control.

Nothing gets lost.

Branches, PRs, relog. Git discipline that survives 96 builds a day.

It works at 3am.

Live OAuth, lockfiles, dedup guards, silent-fail detection. Built to run without a babysitter.

Most AI delivery ships slop.

Ours ships software. Engineering-grade pipeline.
Production-grade output. Built by an engineer who's
been writing code longer than most agents have
existed.

BOOK A 60-MIN BUILD CALL
