

Vendor Enrollment *Engine* MVP.

A small, measurable first build for agents taking over mundane growth ops: one market, one vendor segment, Supabase as the source of truth, and a human-approved enrollment loop with explicit value proof.

\$100+/hr

operator time Florish can trade up into

01 Recommended MVP

Build the Vendor Enrollment Engine for one market first. This is the smallest paid build that can prove the value of agents taking over mundane growth operations without pretending the full Florish platform is ready to automate end-to-end.

No fabricated Florish economics: the matrix uses editable assumptions and proof metrics. Discovery should fill in average vendor value, current manual hours, trade lead value, and conversion baselines.

02 Isaac-informed value framing

Internal positioning note from Isaac's value framing: review Eric's ask by priority, not as one undifferentiated automation request. For each priority, make the business value explicit through a What / Why / So What lens, tying it to revenue or pipeline value, labor displaced, and the opportunity-cost trade-up from \$25-\$50/hr work into \$100+/hr or \$250+/hr work. Use the numbers below as discovery placeholders, not claims about Florish's current performance.

Eric priority

- What operational loop are we automating?
- Why does that loop matter to revenue, supply, demand, or trust?
- So what proof justifies the next paid phase?
- Labor moves from \$25-\$50/hr execution into \$100+/hr or \$250+/hr decisions

03 Value matrix by priority

Each priority is framed through What / Why / So What, then tied to revenue or pipeline value, labor displaced, opportunity-cost trade-up, and a concrete proof metric.

01. Vendor enrollment engine

PAID MVP — FIRST WEDGE

WHAT

Source, dedupe, enrich, review, and nurture vendors in one market with Supabase as the enrollment spine.

WHY

Marketplace supply is the prerequisite for every downstream Florish growth motion. Cleaner vendor density should make trade-customer demand easier to satisfy.

SO WHAT

Eric gets a measurable supply-growth loop instead of paying for a broad platform bet before the economics are visible.

REVENUE / PIPELINE

Revenue unlocked / pipeline value: more qualified vendors can expand available supply, support more quote opportunities, and create the evidence needed to price later phases. Assumption to validate: value per enrolled vendor and expected conversion from vendor conversations to active supply.

LABOR DISPLACED

Labor hours displaced: list building, vendor research, dedupe, enrichment, first-pass qualification, approved outreach prep, and weekly reporting.

OPPORTUNITY-COST TRADE-UP

Opportunity-cost trade-up: automate repetitive \$25-\$50/hr growth-ops work so Eric and senior operators can spend time on \$100+/hr partnership, sales, market selection, and \$250+/hr strategic deal decisions.

MVP PROOF METRIC

Concrete MVP proof metric: one market produces a weekly scorecard for vendor leads sourced, verified records, approved outreach, reply rate, discovery calls booked, vendors moved to enrollment, and opt-outs/bounces.

02. Trade-customer nurture

FUTURE PHASE AFTER SUPPLY PROOF

WHAT

Segment trade customers, capture requests, route quote intent, and trigger nurture sequences once vendor coverage is credible.

WHY

Demand-side nurture becomes more valuable when Florish can reliably match trade requests to available vendor supply.

SO WHAT

Florish can move from ad hoc follow-up to a pipeline motion that compounds every time supply coverage improves.

REVENUE / PIPELINE

Revenue unlocked / pipeline value: improved conversion from captured trade interest into quote opportunities and repeatable demand signals. Assumption to validate: current lead volume, average job/order value, and drop-off points.

LABOR DISPLACED

Labor hours displaced: manual follow-up reminders, status updates, request triage, lead tagging, and CRM hygiene.

OPPORTUNITY-COST TRADE-UP

Opportunity-cost trade-up: shift Eric/team away from low-value chase work into high-value account development, partner conversations, and offer refinement.

MVP PROOF METRIC

Concrete proof metric: nurture cohort shows improved response rate, booked calls, quote requests, or reactivation rate versus a manually handled baseline.

03. Inventory housekeeping

FUTURE PHASE AFTER VENDOR RECORDS ARE LIVE

WHAT

Detect stale listings, request vendor updates, normalize inventory fields, and route exceptions to humans.

WHY

Fresh inventory data improves trust and reduces wasted sales cycles caused by unavailable or incorrect plant-material records.

SO WHAT

Florish protects marketplace credibility while reducing the operational drag of constantly checking vendor availability by hand.

REVENUE / PIPELINE

Revenue unlocked / pipeline value: fresher supply data should reduce failed matches and make more opportunities actionable. Assumption to validate: frequency of stale inventory, lost opportunities, and manual update cadence.

LABOR DISPLACED

Labor hours displaced: spreadsheet cleanup, reminder emails, record updates, stale-list detection, and exception tracking.

OPPORTUNITY-COST TRADE-UP

Opportunity-cost trade-up: move operator time from data janitorial work to supplier quality, margin, and customer-experience decisions.

MVP PROOF METRIC

Concrete proof metric: percentage of vendor inventory records refreshed on schedule, stale records reduced, exceptions resolved, and manual update hours avoided.

04. Marketplace / channel distribution

FUTURE PHASE WITH PLATFORM-RISK GATE

WHAT

Normalize approved listings and distribute them to selected marketplace or channel experiments with audit trails and platform guardrails.

WHY

Distribution can amplify supply and demand, but it carries compliance, brand, and platform-policy risk if automated too early.

SO WHAT

Florish can test channel leverage without betting the business on brittle scraping, posting, or marketplace automations.

REVENUE / PIPELINE

Revenue unlocked / pipeline value: channel experiments may open incremental demand or supplier discovery. Assumption to validate: target channels, allowed workflows, policy constraints, and measurable attribution.

LABOR DISPLACED

Labor hours displaced: listing formatting, channel-specific prep, status reconciliation, and manual experiment reporting.

OPPORTUNITY-COST TRADE-UP

Opportunity-cost trade-up: keep Eric/team focused on channel strategy and partner economics instead of copy-pasting listings across surfaces.

MVP PROOF METRIC

Concrete proof metric: approved channel test publishes normalized listings, records attribution, flags policy exceptions, and reports qualified opportunities per channel.

04 Operating flow

Market definition

- Lead source pull: Google Places / SerpAPI / Apify / Apollo / Clay
- Normalize + dedupe into Supabase vendor records
- Enrich website, category, contacts, service area, notes
- Human review queue: approve / reject / needs research
- Email-first outreach; optional compliant SMS only when appropriate
- Conversation capture + calendar booking
- Enrollment status + next action in Supabase
- Weekly value proof: pipeline created + hours avoided + next-phase evidence

Supabase should own the durable vendor spine: vendors, locations, contacts, lead sources, outreach events, enrollment status, compliance events, labor-savings estimates, and audit logs.

Monthly software cost bands

Lean MVP

\$100–\$350/mo

Supabase starter/pro, basic email provider, small sourcing budget, basic deliverability, simple calendar. Best for validating one market with low volume and human review.

Serious MVP

\$500–\$1,500/mo

Supabase Pro, GHL or comparable CRM, Instantly/Smartlead, Apollo/Clay credits, SerpAPI/Apify usage, email deliverability, possible compliant Twilio usage. Best for real outreach volume and structured weekly reporting.

Scale Pilot

\$2,000–\$5,000+/mo

Higher-volume enrichment, multiple domains/inboxes, CRM + sequencing + call tracking, expanded logging/analytics, stronger monitoring and QA. Best only after the first loop proves value.

06 Future roadmap

Only expand after the first market proves value.

- Phase 1: Vendor Enrollment Engine.
- Phase 2: Multi-market vendor expansion.
- Phase 3: Trade-customer nurture.
- Phase 4: Inventory housekeeping.
- Phase 5: Marketplace distribution with platform-risk review.
- Phase 6: Higher autonomy after auditability is proven.

07 Compliance guardrails

- Cold SMS requires consent review, TCPA posture, and opt-outs.
- CAN-SPAM basics must be enforced from day one.
- Meta / Facebook Marketplace automation is platform-risky and should not be brittle or policy-violating.
- All source, approval, send, reply, opt-out, and status events should be logged in Supabase.

08 Discovery questions

- What exact market should the first MVP target?
- What vendor category has the highest supply-side leverage?
- What counts as an enrolled vendor operationally?
- What systems are already in use?
- What outreach channels are acceptable today?
- What manual hours are currently spent on sourcing, cleanup, nurture, and reporting?
- What weekly KPI would make this MVP obviously worth scaling?

09 Public research note

Public footprint is limited. Search results show Eric Ferguson associated with Florish Technologies, Inc. and Chandler, AZ signals; the email thread remains the strongest source. This proposal therefore assumes Florish is a plant-material marketplace / sourcing platform and keeps discovery questions explicit.

Email draft to Eric

Subject: Florish vendor enrollment MVP

Hi Eric,

Thanks again for the context. I think the best first move is to keep this small and measurable rather than trying to automate the whole Florish growth engine at once.

The wedge I would recommend is a one-market Vendor Enrollment Engine. The idea is to use Supabase as the source of truth, pull together a clean vendor lead pipeline for one target market, enrich and dedupe those records, put the risky steps behind a human approval queue, and then run a measured email-first nurture/enrollment loop.

The reason I like this wedge is that it gives us a practical value test: can agents remove the repetitive \$25-\$50/hr growth-ops work, create qualified vendor conversations, and free you up for higher-value partner, sales, and strategic decisions?

If that works, the same spine can expand into trade-customer nurture, inventory housekeeping, marketplace distribution, and higher-autonomy workflows. But I would rather prove the first loop and then price later phases around real operating evidence instead of guessing.

For our call, I'd like to pin down:

- the first market,
- the vendor segment with the most leverage,
- what "enrolled vendor" means operationally,
- what systems you already have in place,
- and what weekly KPI would make this MVP obviously worth scaling.

I put together a short proposal package around that shape so we can use it as the call agenda.

Best,
Greg
